

ATyS

Motorised and automatic changeover switches from 125 to 3200 A

A totally safe transfer, whatever the application

The design of the products in the ATyS family, based on proven load break switch technology, guarantees both the continuity of the power supply and the safety of operators. Its stable positions allow energy consumption to be minimised whilst ensuring maximum immunity to electrical network disturbances, making this a truly robust and reliable solution.

Ensures availability of the electrical power supply under all circumstances

The functions and design of the ATyS product range all work towards one key objective: ensuring the supply of loads downstream, via **rapid transfer** from one source to another. These products have three operating modes, which increase the ability to select the most reliable source **under all circumstances**.

The products only require a power supply when changing position, which increases their reliability and service life.

Simplicity ensures safety

Thanks to their on-load breaking capacity, coupled with their two operating modes (Auto and Manual), the ATyS are **simple to use** and **100% secure**. The selection of the power supply source to the load can be achieved in three different ways:

- using the front operation handle (Manual mode),
- remotely, using the input for position control commands (Auto mode),
- automatically, depending on the availability of sources (Auto mode).

To ensure technical interventions downstream of the product are as secure as possible, ATyS have a **high-performance padlocking function** which is an efficient addition to the breaking functions.

ATyS family

A **complete range** of changeover switches, from 125 to 3200 A, adapted to all your applications

Five product versions are available, ensuring a solution suited to your application.

Automatic version (ATS) or motorised version (RTS)?

The ATyS t, ATyS g and ATyS p (ATS) versions differ from the ATyS and ATyS d in that they integrate an automatic controller.

This means that **the products themselves monitor the availability of sources, start the generators if necessary and automatically switch to the available source.**

Conversely, ATyS and ATyS d (RTS), require **an external controller** to provide them with switching commands.

Benefits of the ATyS range

Plug and play solution

Integrated auto-configuration

As standard, all automatic versions have the auto-configuration function which enables **automatic setting of the nominal voltages and frequencies** for the network. Simply cable the product, which will then measure the values and record them.

Quick installation

All ATyS products are factory assembled and require minimum cabling, thereby simplifying the installation and reducing the amount of time required to be operational.

For ATyS t and ATyS g, configuration adjustment is achieved via potentiometers, **requiring only a screwdriver and a few minutes.**

Manual emergency control

In the event of an emergency, it can be controlled **quickly, easily and safely** using an emergency handle. This handle is very easy to fit and no motorised or automatic transfer can take place when the handle is in place.

Improved performance

According to IEC 60947-6-1:

- AC 33-B up to 1250 A
- AC 32-B up to 2000 A
- AC 31-B up to 3200 A

Specific genset functions

ATyS g and ATyS p can be utilised for switching between transformer and generator power supply sources. They have a genset run command and integrate **on load and off load test** functions. These functions ensure there is a good connection between the source changeover switch and the generator, and that these are both operating correctly.

The ATyS p also allows **scheduled starts** to be programmed for these different tests.

Continuous information

on product availability

Products in the ATyS range are equipped with a Watchdog relay which **constantly monitors** your product, thereby securing your installation.

This relay informs you of the capacity of your product to switch correctly following an electrical or automatic order.

Robust products

All ATyS product versions are designed and tested in accordance with standard **IEC 60947-6-1**, the benchmark for changeover switches offering optimum design and operating features.

The benefits of ATyS p

Simple configuration software: Easyconfig

The **Easyconfig software** is ideal for reducing the time spent during complex configuration operations.

It allows the following parameters to be configured:

- type of application,
- voltage and frequency thresholds,
- timer values,
- inputs/outputs...

Communication options which make the difference: Modbus, Ethernet and Webserver

Thanks to optional modules, ATyS p communicate using **Modbus** and **Ethernet** protocols.

The Ethernet communication module also integrates the **Webserver** function, allowing the ATyS p to be accessed via a web browser.

The Webserver function enables:

- product status display (product position and source status),
- the display of voltage measurements,
- the display of configured parameters,
- access to the event log.

Additions to the range

ATyS S and ATyS Sd Motorised changeover switches from 40 to 125 A

Specially developed for manufacturers of small generators, ATyS S and Sd enable simultaneous breaking and switching between two power supply sources up to 125 A (< 90 kVA).

ATyS S 018 A

ATyS M modular changeover switches from 40 to 160 A

Three versions of ATyS M (remote-controlled and automatic) are available to meet the vast majority of your source switching application requirements.

ATyS M 007 A

SOCOMEc, your best asset

SOCOMEc is an industrial group specialising in the availability, control and safety of low voltage electrical energy which meets the requirements of the industry and the service sector.

Disconnection, breaking, control... Since 1922 Socomec has gained a wealth of experience in these fields. The back-to-back manual changeover switch, designed and manufactured

by Socomec and now available in a compact motorised version, has become the world reference in power-switching.

Four key applications: the know-how of a specialist

Ensuring the availability of high-quality power for critical applications.

Managing power and protecting individuals and property.

Improving the energy efficiency of buildings and facilities.

Guaranteeing the safety and durability of photovoltaic (PV) facilities.
